The library was made so that the biotinylation peptides are expressed in a fusion protein at the N-terminus of cytoplasmic melrose binding protein (MBP). The ability to express functional biotinylation sequences free at either end of a protein indicates that there is no requirement that either end of the peptide free in order to interact with the biotin holoenzyme synthetase. The peptides can be biotinylated in vitro or in vivo, especially with BirA biotin ligase, and used for the purification, immobilisation, labelling
biotinylation of proteins synthesized by recombinant DNA techniques in vivo with a biotinylation peptide of less than 50 amino acids. The method comprises: (a) on the surface of a substrate, providing a fusion protein comprising a recombinant protein and a peptide defined by the

This invention describes novel nucleic acid sequences (A) that are expressed at high level in normal prostatic tissue. Polypeptides (I) encoded by (A) are used: (a) for identifying agents for treatment of prostatic cancer and (b) for therapy of prostate cancer, optionally where expressed by gene therapy methods. (A) is also used to isolate full-length genes (for gene therapy) and for recombinant production of (I), which can be used to raise specific antibodies. (A) are identified by assembly of ESTs (expressed sequence tags) before these are analyzed for expression pattern (tissue specificity). This approach eliminates many of the false results, as regards tissue specificity, associated with known methods that use single (usually short) ESTs. ANY48304-Y48456 represent peptides encoded by the expressed sequence tags described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        biotinylated by a biotin ligase at the lysine residue adjacent to position 8 and is 13-50 as in length; (b) in a predefined region of the substrate, contacting the fusion protein with an enzyme; and (c) determining whether the fusion protein has been biotinylated. The method allows the identification and purification of biotinylated enzymes e.g. BirA. The method is also useful in research and diagnostic applications. The method uses small but specific peptides, allowing the labelling of a protein at a defined site, this provides improved immobilization and avoids the use of antibodies. AAY2443 to AAY2458, and AAY2929 to AAY29312 represent specifically claimed examples of biotinylation peptides for use in the method of the invention.
                                                                                                                                                                                                                                                                                                               WPI; 1999-519629/44.

      fertile, transgenic plant whose genome has been augmented relative to that of the corresponding non-transgenic recipient cells through the stable introduction of the polynucleotide composition. The invention provides for the identification of DNA segments encoding the fungal pheromones, and compositions comprising pheromone polypeptides, which inhibit fungal growth and development and prevent or reduce fungal infection and/or disease in plant host cells. Also provided are methods and processes utilising fungal pheromone and pheromone derivatives in the prevention and treatment of fungal colonisation of a plant.
                                                                                                                                                                                    This is a MFalphal mating pheromone from Cryptococcus neoformans used in the preparation of a transgenic plant with increased resistance to fungal infections. The transgenic plant's genome is augmented by the introduction of a fungal pheromone gene, which confers resistance to fungal infection. The transgenic plant is prepared by a process which comprises obtaining a polynocleotide composition comprising 1 or more functions.
                                                                                                                                                                                                                                                                                                                      Transgenic plant, whose genome contains a fungal pheromone gene has increased resistance to fungal infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cryptococcus

                                                                                                                                                                The specification describes an immunogenic epitope of a Mycobacterium vaccae antigen. The epitope is a stimulator of cytokine production. The epitopes are useful for threatment of immune disorders, infectious diseases, especially tuberculosis, and cancer. They are also useful for treatment of other mycobacterial infections such as those caused by Mycobacterium avium. The epitopes are especially useful those caused by Mycobacterium avium.
                                                                                                                                                                                                                                                                                   Novel polypeptides comprising immunogenic epitopes of Mycobacterium vaccae, useful for treating mycobacterial infections, immune disorder and cancers

This peptide is capable of facilitating transport of an active agent e.g. a drug through gastro-intestinal tissue. The present sequence may be used as an immunogen, for the generation of antibodies which specifically bind to the present sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  medical conditions e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 67 polynucleotides of the invention, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and fetal deficiencies, blood disorders, leukemias, disease, inflammation, altergies, ischaemic shock, Alzhaimer's and renal disease, inflammation, altergies, ischaemic shock, Alzhaimer's

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
